On the bus in five minutes.

Busclear shows what happens on your KNX bus: every telegram in plain text, with the names from your ETS project. This is how you get started.

What you need

- **A KNX IP interface or IP router** in the same network, for example from MDT, Gira, Weinzierl or ABB. Almost every installation has one.
- **Your ETS project** (`.knxproj`), if you have it. It works without: you teach addresses in by pressing push buttons.
- **No risk for the installation:** Busclear listens. It only writes when you explicitly ask it to.

Pick your way

ADD-ON

Home Assistant

Runs all the time and keeps recording, also with no browser open.

1. In the add-on store under ⋮ › Repositories enter `https://github.com/regetskcob/KNX-Monitor`.
2. Install Busclear, start it and show it in the sidebar.
3. Pick the gateway or share the KNX integration's connection.

busclear.de/en/addon

APP (BETA)

iPhone, iPad, Mac, Android

Walk through the house with the device in your hand. Everything is unlocked in the beta.

1. Open the beta page and follow the steps for TestFlight or Google Play.
2. Start the app; it looks for the gateway in the network.
3. Tap Connect.

busclear.de/en/beta

RASPBERRY PI

Busclear Box

A small box on the bus that records on its own. Also as a Docker container.

1. Write the image to an SD card or SSD and start the Pi.
2. Join the box's Wi-Fi or scan the QR code on the sticker.
3. Pick the gateway or use the KNX HAT.

busclear.de/en/box

Get to know your installation.

You bought or built a house with KNX and do not know yet how it all fits together? That is what Busclear is made for. You need no prior knowledge and no ETS.

KNX in four terms

Device

A push button, actuator, detector or weather station. Each has an address of its own like 1.1.12 by which it is recognised.

Group address

A function such as "switch kitchen light", written as 1/2/3. Whoever belongs to this address listens and reacts.

Telegram

A short message on the bus: who sends, to which group address, with which value. Busclear shows each one in plain text.

ETS project

The file in which your electrician planned everything. It provides the names. Ask for it, it belongs to your installation.

How to start without any risk

1. **Look at the demo house**
   No installation and no interface needed: "Try the demo without a KNX system" on the start page shows a sample house with real sequences.

2. **Learn KNX**
   Five short lessons with a quiz, from "How KNX switches" to "Questions and answers". "Try it" takes you to the matching place in the app.

3. **Teach your installation**
   No project at hand? Press a push button, the app catches the address, and you give it a name. Room by room this becomes your own directory.

Questions you can answer afterwards

- ? What happens when I press this push button, and which actuator reacts?
- ? Why did the light come on at night, and who switched it?
- ? Which devices never report, and which send unusually often?
- ? Is the installation healthy before I call the electrician?

The first steps

1 Connect

Busclear looks for the interface in the network. If it reports "no free tunnels", another program is holding it, often ETS or a visualisation.

2 Load the project

Import the ETS project, also with a password. Addresses like 1/2/3 become names, rooms and devices. Without a project: press a push button and name the address.

3 Read the overview

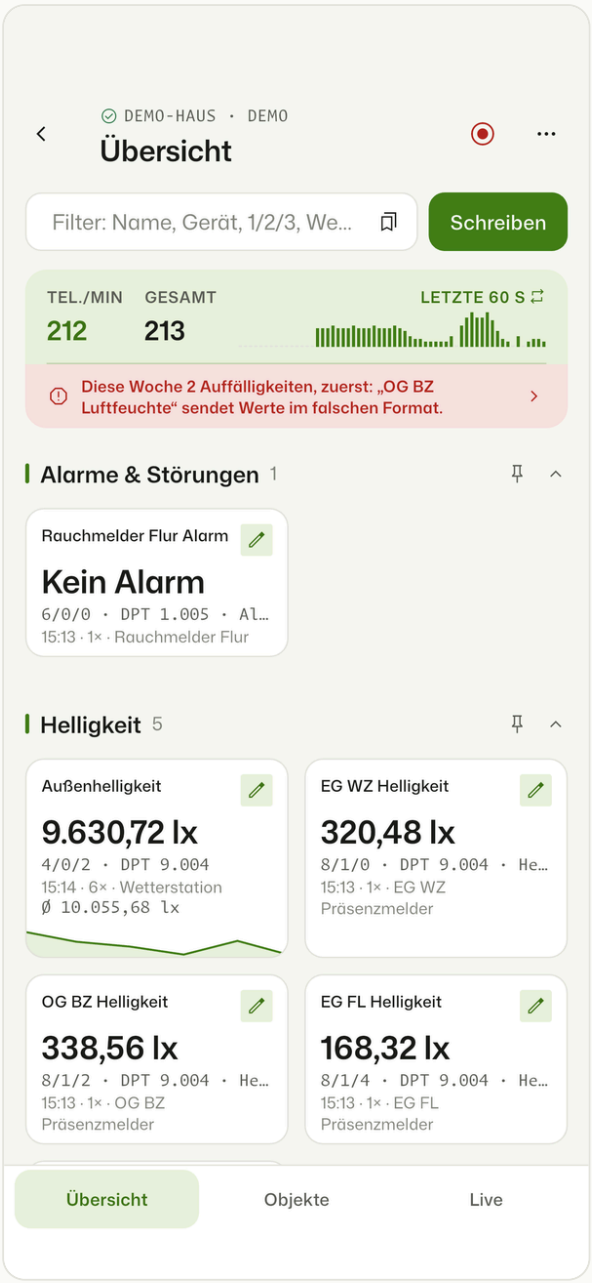

Values sorted by topic: lighting, heating, energy, alarms. Tap a card to see its history and who sent.

4 Check the health

One run queries the status addresses and names what does not answer or sends unusually often. It is the quickest look at the state of the installation.

5 Keep watching

With the add-on or the box the recording goes on. Watchers tell you when an address reaches a value, and the "Last 7 days" card sums up the week.
